

“Create Study On Cloud” Design Review

The discussion focused on defining the UX flow for **creating a study directly from PLEXOS Cloud** using predefined starter structures and how it should connect with **Marketplace**.

1. Objective / Problem Statement

- Goal: Enable users to **quickly create a predefined study structure** for:
 - Gas
 - Water
 - Electric
 - Universal studies
 - Current gap: Users currently need to create studies from Excel/Desktop and then move them to Cloud. The goal is to make Cloud the starting point.
 - Focus is creating a **basic starting point**, not replacing Marketplace or creating a complete study ecosystem.
-

Design Options Discussed

Option 1 — Create Study button on Top Navigation

Initial exploration:

- Add “Create Study” button in the top band.
- Clicking opens options/templates.
- User selects Gas/Electric/etc. and starts creation.

Concern:

Top navigation is already becoming crowded:

- Study version
- Tenant name
- Notifications
- Other future controls

Also, creating studies is not a frequent action, so giving it prime UI space may not be ideal.

Option 2 — Create Study inside Study Dropdown

Idea:

- Use existing study dropdown.
- Add “Create Study” inside the dropdown panel.

Concern raised:

A new user may not know:

“Click the study dropdown to create a study.”

For a new tenant with no studies, the entry point may be hidden.

New Tenant Scenario Discussion

Important scenario identified:

A brand-new customer:

1. Gets a new tenant.
2. Has no studies.
3. Adds users.
4. Needs a starting point.

The team agreed this scenario needs a different handling approach. Possible solution:

- If tenant has no studies:
 - Show a modal/recommended starting studies.
 - Guide user toward creating the first study.

Marketplace Integration Discussion

A major requirement:

Starter studies are already being created by another team and published in Marketplace as playbooks. These include:

- Electric starter study
- Gas starter study
- Future Water/Universal studies

The intent is to reuse this work instead of creating duplicate templates inside Cloud.

Marketplace contains:

- Playbooks
- Insights
- Reports

Starter studies are represented as **Playbooks** containing packaged studies and Excel templates.

Final Direction Discussed

Agreed direction:

User flow:

1. User clicks Create Study entry point.
2. User selects:
 - Gas
 - Electric

- Water
- Universal
- 3. User is redirected directly to the relevant Marketplace Playbook page.
- 4. User clicks **Add to Cloud**.
- 5. User creates the study in their tenant.

Important:

- Do NOT send users to the whole Marketplace.
 - Deep-link directly to the relevant starter study/playbook page to avoid confusion.
-

Key UX Insights

1. Separate two user scenarios

New user / new tenant

- Needs guidance.
- No existing studies.
- Should see recommendations or onboarding guidance.

Existing user

- Already knows Cloud.
 - Needs quick access.
 - Can use study dropdown/create flow.
-

2. Avoid over-promoting Marketplace

Discussion point:

Marketplace is valuable, but the user's intent is:

“I want to start a study quickly.”

Not:

“I want to browse Marketplace.”

Therefore, the UX should minimize unnecessary navigation.

Open Decisions

1. Where should **Create Study** live?
 - Top UI?
 - Study dropdown?
 - Conditional empty-state modal?

Decision pending discussion with broader team.

- 2. Need demo/understanding of:
 - New tenant creation flow
 - What happens when tenant has zero studies
- 3. Validate:
 - Number of future starter templates (4 vs 10–20+)
 - Impact on UI scalability.

Action Items

Owner	Action
Vishal	Discuss Create Study placement with broader UX/product team
Team	Provide new tenant onboarding demo
Team	Confirm Marketplace deep-link feasibility
Product	Clarify starter study count/scalability
UX	Document final workflow

Main Takeaway

The solution should **not create a new template system inside Cloud**. The preferred direction is:

Cloud → Select Study Type → Directly Open Relevant Marketplace Starter Study → Add to Cloud → Create Tenant Study

while handling **new tenants with no studies** through a guided onboarding/recommendation experience.

from the discussion on evx proposal on creating a study on cloud let me share my screen quickly
okay

you guys must be able to see my screen right okay so there are a couple of many items first one is document where i'm summarizing the stuff about the approach and other findings during the work creation that i've gone through There are a couple of options that you can see.

TB means top band options. That is around five options that we explore.

Then we change our approach. I'll explain that why. Then we go ahead with the drop-down approach.

The approach that we have currently, we have to study drop-down from here. We can see all the

studies and things like that. And we have short work on how first time user experience will be like finish.

So what our problem statement over here is or what we are trying to achieve through this particular feature is quickly create a predefined structure as a starting point for gas, water, electric or universal study the cloud itself. Right now there is no provision for this on cloud. And this is the first steps for the starting the phrase study from the cloud and taking it ahead, making it much matured. And you're not taking ahead towards the goal.

User story, value proposition, its possibilities and all this enables.

It's enables. OK. All these pointers, I have taken it from the features and just color board edit.

I just highlighted a couple of points to keep the requirement on priority.

There are a couple of things which are not aligned with this top priority, which is creating a study on cloud with the predefined structure.

So as I said, creating studies from Cloud UI is the first and prominent goal.

Quickly set up a new project in Plexus Cloud, and then user can utilize it in a desktop or Excel ID.

I have a little different opinion on this particular thing, user-friendly entry point in Plexus Cloud. We have established workflow on allowing user to cloud how it's entering in the cloud.

And if you wanted to improve that, that is a separate use case that I will fill.

Creating a study directly in cloud UI. That's what we are targeting.

Template it from the marketplace. My question is, why would user go to Marketplace?

Because it's a huge data library. And our goal is just to create a starting point or predefined structure around four categories like gas, water, electric, and universal.

So this is a different use case.

reduce the setup time and agree with that if you want user wanted to go and start with a fresh story in cloud first right now you need to go in excel or text drop create from there and then he jump to uh cloud so uh we don't want to do that from the user side uh faster onboarding from user studies uh this is again different use case i would i'll say uh reducing the setup complexity uh because we are uh giving the pre-defense set as per the uh you know our goal as per our objective over here right uh build a uh study study around this for uh four categories gas water in your sun and electricity uh streamlined integration with flexus cloud this is already there right uh it's nicely synced uh i would say uh

We are providing standard study template within the cloud itself and encouraging and reusability.

So for that user can jump on the marketplace and from there he can use whichever data set he wanted

to use or scenario, whatever it is available there, that is already there.

Acceptance criteria. So while discussing with the development, discussing with the UX team and gone through a couple of reviews, self-reviews and things like that.

I feel that we can take these steps a little bit here and there. I'll walk through that.

So as I said, initially we started with keeping the create study button on top.

from where user will open the, you know, some dropdown and he can click and jump to the, from where he can access to the, from where he can launch the new tab, where he can create a new study, right? But you can see that there is a couple of things already, which is already discussed and designed, and that soon will be in a cloud, right? You can see study version, we have long tenant name, notification icon will be there soon. so we don't want to keep it so in that case we don't want to keep the create study on top band and creating study it's not that frequently used like user don't create the study like every after one hour two hour or something like that a user will create the study like not that frequently and again this is not a prepared place place for it because all this information has a different characteristic than study so we drop that idea but we create a couple of options like we club you can end the option one so top band design options in option one what we explore that we club this marketplace and create icon together and clicking on marketplace marketplace will launch or the user can create a study like clicking on electric and gas and whatever it is uh this was option one an option two like we can keep the marketplace icon as it is but clicking on this particular create study uh clickable uh window model window will open and i have a full i can see that i can start with anyone out of this uh basic study of other option we explore that we can keep the plus icon next to the uh drop down study top down it's like keeping the two similar sort of uh component together close by uh in a close proximity so that is i will understand this this is something study related and we can go and explore it uh we can optimize with keep keeping on the plus icon there, there is a little exploration from the other side if you wanted to go ahead with that.

Then we thought of like we can keep the drop down kind of button and the arrow will indicate that something is there. It's not straightforward click, straightforward button kind of thing, but by clicking on the button, clicking on that particular component, something will open. And what is opening is the basic template for the studies that user wanted to launch to start operation other than that we have explored the drop down option right so we have study drop down on top and what happens is as i click on study drop down the panel will open up and as soon as user panel as soon as study panel is opened most of the

things is uh i mean as it is no changing change in that except that we need to like give the more real estate to the to the content that is there uh and it has value to it because right now things are like cramped in it and i suggested that in uh other feature as well here you can see that study uh create study and uh i have straight away uh given clickable buttons with the tooltip tooltip can elaborate little more to user what is happening once user click on it.

Any questions so far?

Hello. Yes, Vishal.

I don't think we can do the create study thing inside the study dropdown.

Reason being, let's say any new user has logged into Plexus Cloud.

he doesn't have any study created on Cloud yet. How would he know that he needs to click on the dropdown to start a new study? That's why it would be good if we can provide the option upfront on the UI rather than keeping it inside a dropdown. That would be my suggestion.

What is the current flow? As soon as tenant is adding the user,

Any user. He'll get to see the studies. By default, he will be landed to any public study.

And if you wanted to go and change it, he will definitely go and open the dropdown. And here, there you can see all the public study. There are some studies which he has to request for access and things like that. That flow is already there, which is why we are keeping it under the dropdown.

We wanted to break that flow. Are we going to establish something new in that front?

Then we need to think according to that. So right now the flow is as I'm adding a new user.

New user will be going to see what your public studies are there, whatever. That will happen if public studies are present on that tenant. What if they are not?

What if they are not? What if a completely new tenant is being set up? Because we have got a new customer on Plexus Cloud today, but they don't have any studies on cloud yet. They are starting to build something from scratch. So, see, I agree with the point that we do not have a landing page today.

That is a different use case. That is another use case, I would say. Let's say I am a user.

A scenario, I will say. That is a scenario. What if? In that case, we can define some other approach. So if there is nothing, then we'll show the model window where we can start with something fresh.

okay so i was saying that there are two more like there are more issues with this approach like suppose if i add two three more templates so there won't be space to add those here uh how many templates are going to come uh as per our discussion uh right now we have gas and electric uh and later on water and universal will be added is there is this list is going to be uh quite huge yes

so this list keeps changing like down the line six months or one year we may have another that might happen no one no one knows right now how many are going to be there that might happen but maybe after one or two years down the line we'll have six instead of four but i cannot say it right now but still i think Putting it up front on the UI would be helpful, Vishal. The options that you were showing us above.

So I already raised the concern. Okay.

Is that prominent? Like, is user is going to click? Is that so prominent for the user?

Is user is going to create a study every day, regularly? So based on the user need, user frequency appears. we utilize the space, right? The scenario that you ask, right? I'm agree with that. So how rarely that tenant would have anything?

Wouldn't have anything. Tenant has nothing in his end, which is why other end is nothing going to reflect. That is again a real scenario. For that, we can define something else. With every new customer, this would happen. A new customer comes to us, we set up a new tenant for it. So... with every new customer we are we will be encountering this case okay so uh i'm agree with atul's point uh how uh this will be fixable if there is a number of the uh study is uh increase okay that is one point uh but i won't be agree on the uh keeping the study uh keeping the you know uh study grade on the top up front okay uh we need to go with the broader audience with that okay okay so if you are uh saying that maybe i can discuss this with ekta and abhishek once okay uh yeah it's it's always good to take opinions from others also so i'll discuss with that with them also okay i'll get back to you okay and uh

Can you please revert back to on the feature, the question that I asked on the feature?

Right. I listed out some question and ask you some feedback on it.

Okay. I thought in the grooming call, I answered those questions, but okay, if you want it in return, I can put it on DevOps. Yeah. I'll do that.

show this to the other superiors right so it's better to keep the documented okay so and uh if you mention that uh uh in the feature that this list can be increased uh we cannot predict anything right now like we this won't be great so you would not remain only four it would be six seven or more than ten okay so just give some clear idea how big that will be okay uh will it be infinity or will it be define some name numbers around it and if you have some visibility around it's depend on visibility right depend on visibility depend on flexibility depend on importance design decisions make a call otherwise we won't be able to make the appropriate calls about it okay let's proceed yeah and another question How frequently does tenant won't have anything in his plate?

That I said, right? With every new customer, this would happen. Yeah, so tenant side.

Yeah, yeah. Customer resides in a tenant, right?

If you are a customer of Energy Exemplar and you came to purchase Plexus Cloud today, so I will set up a new tenant for you. for your company and on the first day you would not have any studies on the plexus cloud because your tenant is newly set up you are the tenant admin and now you will start adding users to your tenant so you will start from scratch on your tenant okay can you demonstrate me uh after this call quickly i wanted to see how can i do that because i cannot set up a new tenant for for the demo right okay can you direct me to somebody else or you can can you schedule some call with some who can perform it wanted to understand is how it's going to be operating today and how we can take ahead existing to the next level looking at this in this context okay let me think how should we contact let's see okay cool

Okay, these are the workflows. You can go ahead and explore that.

So what I was thinking is the drop-down, study drop-down.

You can see that all other accordions, recent study, period, others, and no access. There are some recommendations from my UX site that I'll get out in some other documents. But let's see if I wanted to... create a gas study or something like that.

I simply click and what happens is it will open a... It will open what?

It will

open a new tab and there you can define the name.

Okay, let's explore both the workflows. One is the steady drop-down thing as you are demoing right now and other is the options that... the create study option directly on the UI, right? So let's have a look at both the workflows and then I can talk to Abhishek and Ekta on which one should we go ahead with, okay? Abhishek, Abhishek More or Abhishek? Yeah, yeah, yeah.

Abhishek More.

Let me... If

this is not working, let's go to option one, two, three, maybe because we just have eight minutes left.

That's okay. Do you have a hard stop or something? Yes, I have a meeting at 4.30.

files are quite heavy okay so as i click as you can see over here in the screen yeah so new tab will open where i can define the study name and a study registration description and the button will be create and copy to tenant okay and as i click on it uh the study will be new study will be created in the new tab sites so i did the discussion things like that A new study will be created now.

Okay. That's about my time. Thank you. Okay. And another one.

So just one point, Vishal, this workflow that you showed right now doesn't include marketplace.

And one important thing is that we want users to leverage marketplace as much as possible because marketplace is where everything, every content, every data set, every playbook, Everything that we build will come to Marketplace eventually. And that's why, I mean, they wanted us to redirect users to Marketplace to get starter studies from. Now, what is our objective here? Our objective is create a study which is set up in a cloud. Both are our objectives. We want to expose Marketplace as a platform. also and we want to let users create study also from cloud. No, so right now that marketplace availability here, do we want it to promote? Is this a promotion kind of thing? Are we creating, are we promoting the marketplace? Not only here, everywhere we are promoting marketplace. No, no, no. What my question is, our objective is we want to quickly set up a starting point in the cloud itself. okay and it's a basic study basic setup both basic a basic setup my question is that if i wanted to do a base quickly set up a study why should i navigate to marketplace where i have bunch of studies okay when a simple click can launch is another tab where i can define the name and user can start what do you want it to start with where is that study where is that study You said you will click on electric, where will the user navigate to copy to his tenant? You have given option copy to my tenant but from where?

So by creating copy to tenant, study will be added to the tenant. How come?

Where will the user get information, create and copy to what he is copying to his tenant?

The study will be created to tenant. Right now, what is the current flow?

I am creating a study in desktop and pushing it to the cloud.

You are right. But the problem is, not problem, but the use case is, there is a team in Pune office who is working on building these starter studies for electric, gas, universal, water. And they are publishing their studies to marketplace. So we want this feature to incorporate the work that they are doing on studies here.

So basically, we want to leverage their work. Their work should not go in waste because they are working towards creating that starter studies.

They have already built the input and output part, which is a very basic setup which any new user would need. So their studies, the studies that they are building is a very basic study as you were talking about, right? Basic setup. They have already done it for electric and gas. We want to leverage their work by just redirecting them. to the marketplace where they have published their studies that was the main objective okay so uh are we setting up the new tab or something on a marketplace for it right no no no no those those are in the form of playbooks and that is how we want to go ahead with is what i've got to know from abhishek but how does user know that this is a

basic setup or starting point setup how does it run all that

Description, right? Description. But how many description user will see?

Let's not worry about that part, Vishal, because they already are building that basic setup.

They are naming it accurately. They are providing description accurately on that. They are handling those things on their part. We really need not to worry about that. My question is very simple.

So there are a bunch of studies on marketplace. There are lots of studies,

lots of data set. So my question is, our objective is we wanted to provide a starting point to the user, a basic starting point. That's what our objective. And it doesn't have any use case specific.

Gas will be one, water will be one, universal will be one, electric will be one,

and there are a couple of more. How many of it will be? 10 to 15. i'll take max max 20 right if i

wanted to keep only gas in the gas section a basic study a starting point study how user will find

that does he will search for it then does he will have a specific name i mean so if a user clicks

on what kind of identity it will have a different identity i'll say if you go on marketplace if you

go to playbook section you have let's say 100 playbooks there so your question is how will the user

identify his study right but if you click on particular card on any playbook it will navigate you

to the home page of that playbook and the home page displays all the details of that playbook or

that study right so from there user will get to know that So we will let user navigate to that

homepage directly then rather than navigating it to the entire section of playbooks where there are

hundreds of playbooks. Okay. Yeah, but then how many previews does user will see and how we will find it?

Homepage will have a description, right? Yeah. Study name,

study description, preview images, everything. So my... a user, my objective is I wanted to have a

basic starting point right on the cloud. Let's say I agree with that. Let's navigate to the

marketplace. How I will find that?

Are we providing any name or something like that? User will search on it. Okay. Yeah.

You are on pre-prod, right? Okay. Can you go to marketplace? I can show you one example of a starter playbook. Yeah, you can share your screen if your machine is quite slow.

Yeah, I also have...

Okay, my meeting is shifted to 4.30, so that's okay. I can be on the call.

Okay, let me share my screen.

Is my screen visible?

Okay, so this is the marketplace UI. We are having different tabs over here,

playbooks, insights, reports. Okay. The starter studies that we are talking about for electric,

gas, universal, water, those are in the form of playbooks. Okay. A playbook is nothing but a study

packaged with some Excel templates on top of that. But there is an underlying study attached to this playbook. So when you add to cloud, you can see that all inputs and outputs being modeled. for your study okay so the team has already built this playbook for electricity this is that particular playbook plexus playbook for electricity analysis this is that starter playbook that prashant's team has built for electricity similar will they will build for gas universal and water also okay so the point is we want to let users navigate directly to here directly to marketplace

Okay.

So homepage or a screen that you're in earlier. Here, you wanted to navigate over here, right? Mm-hmm. So now, let's say I landed over here.

And now, how do I quickly find the starter study that we are talking about? My requirement is simple. I just wanted to start a fresh study on cloud. So I navigate to marketplace. Now, how do I find over here that starting a starter point? Direct homepage or... Here, this URL, we will let users... Home page. Yeah, this homepage. Yes. And then here only we have add to cloud button. So users can directly add the study to cloud. Now my question to Atul, Akshay and others, we can let users directly navigate to this particular URL, which is the context of a particular playbook, right? Rather than navigating him to the entire marketplace section. This is doable, right?

This is something that we'll need to hard code at our end that whenever a user clicks on electric, he will get navigated to this particular playbook only on marketplace.

Any thoughts?

I believe we can do that. I will have to confirm with marketplace team.

Okay.

Yeah. Yes, Vishal. You were asking something. No, that's fine. If we are jumping directly to the... home page or detailed page, that's fine. Yeah. So I was confused about this page.

So marketplace, we have a whole lot of things and then user will easily get lost with the unwanted stuff that he doesn't have intention with. Yes, yes. Marketplace will have many things.

So that's why it is even my recommendation to the dev team that it would be good if we can let users navigate to particular playbook and its homepage rather than the entire marketplace screen.

So this is how they are naming it. For gas, it would be called Plexus Playbook for gas analysis.

That is in progress. They are building it. Yeah, that's fine. They can name it anything that they want. I just don't want the user to expose with the unwanted stuff. As a user, my objective is I wanted to launch and study quickly. I don't want to go to the marketplace of somebody else, somewhere else. But since that's a must-do thing,

we can do that. But I'm not angry with that. Anyway, that's a different story altogether. But I will feel that one click. tab is launch. I'll define the name and things started from there.

That's it.

So that could be the easiest way. If there is a technical challenge, development team is here.

They can put up their thought around. But that could be the easiest way for the user to launch.

See, Vishal, I can take feedbacks on the...

thing where you mentioned about whether we should have the create study button in drop down or directly on the UI. This is something that I can take up with Abhishek and Ekta. I can discuss with them. But I am very sure that they want these things to get navigated from marketplace.

So that is the requirement that they have discussed with me. So I cannot change that thing.

Definitely. Product is not trying by my own wish. Okay.

So you have a word with them. You can pull me in if you want to.

You can have a word with whichever. I don't know what is the view panel.

Anyway. So take out this.

We are navigating to Mark. But before jumping on to conclusion.

The workflow with, I mean, where you demonstrated the six options of create steady button, right? So there can you show like after clicking there, what exactly would be the next steps for the user?

If you can quickly reshare the screen. There will be the drop down and the user can choose any option that he want. That's it. No different as such. And you are saying that when the user will select electricity from there, this pop-up will occur there also. So let's say launch.

Okay. And as the creator, like study or something.

If I say, okay. So create study and define the name.

Okay. And creating it will launch a new tab.

no so that's what we didn't take into account the marketplace thing here but yeah we need to do that and when you click on add to cloud on any content on marketplace you get this pop-up of naming your content right so at that time you can name it yes yeah so you have tried that right exercise so flow here is i'm clicking anyone out of this okay workflow is broken down okay So let's say user has click on add to cloud and defining name description and clicking on create will create a study on new tab. No. So add to cloud button would not appear here.

Add to cloud button can only appear on marketplace. Okay. Yeah.

That is why this route is via marketplace.

So everything will be routed by marketplace. Yes.

So once user created the study, where does it save?

It will save to tenant. In his tenant, right? So then nothing to do with this thing over here to the marketplace. So I'm saving it. I'm just, what my thought process is here is whatever we have created as a template or starting starter on our... uh marketplace that can be utilized over here and from here users will you know create use that template right rather than marketplace so if user launch from marketplace that is another workflow which is already there we are not disturbing that this is something quicker way we are trying to establish here we are combining plexus cloud and marketplace ui together I don't think that was ever in our vision to do that.

Okay. So even if I take this to the leadership team, they would not agree for this. Okay. So then we need to rewrite this thing.

We have to create the study from the marketplace. So we need to pick the little requirement, little marketplace oriented. We are creating a story by using whatever study we have as a starting point on marketplace. So that way we'll bound to that particular problem statement.

Have I not mentioned in my description or acceptance criteria about marketplace?

Yeah, you have mentioned.

I'm not denying that. Okay. So quickly, why should I jump to...

marketplace. That's what my question is. And this will come to any UX designer or folks.

Why should I go to marketplace? I can create here itself.

That's obvious.

So we need to check all the possibilities, the best possibilities, the probabilities.

Then we think on the other options. Anyway, so anything else from your side?

Should we conclude the call?

Nothing from my side. Anything from the dev team?

No.

Okay. So let's summarize the call. You please demonstrate by you or somebody else to how this onboarding happening on tenant side. I wanted to see that. Please arrange that for me.

Other than that, we have to have integrate the marketplace. So as is a click on any gas, electric or universe or electric. uh whichever study he wanted to start with user will directly jump to the previous screen and from here from there he will add to cloud and that flow will remain the way it is there is no change in that right we are not optimizing that yes we are not optimizing that at all that will remain as it is no change in that yes okay so uh and the option uh uh so there are as i already shared the screenshot there are uh study uh version is going to come there is a long name for the tenant there are a couple of more uh buttons that is going on to top a top band so top band will be fully crowded so we have explored two options either in drop down and either drop and drop and it's not possible because as i mentioned that it's already crowded so

based on uh

proximity how frequently that user is using we need to make a call right and in terms of if there is nothing and user wanted to launch a new study maybe as soon as you log in and there is nothing then we can show the pop-up window or some message or something later from or we can in fact superimpose some recommended studies to the to the to the user right as soon as i'm going to any any platform definitely i'll have get some recommended uh stuff to start with uh that's ideal approach uh if that's followed by industry uh we can uh follow that uh yeah so we need to validate this so this is one scenario we can capture that if there is nothing from tenant side user side we can show the model window recommended stuff and you can start with using that by launching marketplace Right. Yeah. And if he's a regular user, he has and wanted to launch something, he can open the drop down and launch whatever he want. Okay. So a couple of things that you would require from my side is a conclusion on whether we want the create steady button inside the drop down or on the UI. That is one thing. I'll get back to you by tomorrow on that. and another thing is you would want to connect with someone who would uh i mean who would like to demo you how the new tenant is created and what happens after that right you want information there is nothing if there is nothing yeah i got it yeah okay let me see if i can connect you with someone so also yeah so while having a discussion with the broader audience please disclose that there is a study version is going to come there is a uh tenant name is going to come there are a couple of icons notification and things like that coming on top end so top band is crowded so yeah i'll mention this just mention that so based on that they will make the decision okay sure yeah

sounds good

okay

sounds good uh anything else should we wrap up the call yeah

i think we can conclude All right. Thanks, Vishal. Thanks, everyone.
