

Summary — Map Layering & Properties Panel Workflow Review

Objective

Review and validate the updated end-to-end workflow for **Map Layering, Data Cards, Visualization layers, Properties Panel interactions, Pinning, and Show/Hide behavior**. The goal was to ensure a consistent user experience while handling layers across different panels.

1. Layer Positioning & Floating Data Card Behavior

- The workflow has been updated so that when users switch visualization types:
 - **Data Card always stays on the top/floating layer.**
 - Other visualizations (Bubble, Bar, Heatmap, etc.) move below based on interaction.
 - Example:
 - Changing from Data Card → Bubble keeps the Data Card fixed at the top position.
 - Switching visualization types updates the layer order automatically.
 - This avoids users repeatedly adjusting placement manually.
-

2. Pinning & Editing Capabilities

- Existing pinning functionality remains unchanged.
 - Users can:
 - Hover and open the Edit panel.
 - Pin selected items.
 - Clear all pins.
 - Modify properties like:
 - Value
 - Unit
 - Property object name
-

3. Layer Ordering Behavior

- Selecting a property from the Properties Panel moves that item to the top of the Map Layering panel.
 - Example:
 - Selecting Max Volume updates the Data Card value.
 - Moving Max Volume higher/lower in the layer order updates the displayed card value accordingly.
-

4. Layer Visibility (Show/Hide) Discussion

Current behavior:

- If a layer is hidden from the Properties Panel:
 - It disappears from the Map Layering panel.

- If a layer is hidden from the Map Layering panel:
 - It hides visually but remains available in the layer list.
 - User can enable it again without returning to the Solution Panel.
-

5. Main Technical Concern: Single Source of Truth

The team discussed inconsistency between:

- Properties Panel checkbox behavior
- Map Layering checkbox behavior

Concern:

- If hiding from Properties Panel removes the layer completely.
- But hiding from Map Layering only hides it visually.

This creates two different behaviors.

Suggested direction:

- Maintain a **single state/source of truth** for visibility.
 - Avoid tracking separate states depending on where the user clicked.
-

6. User Experience Scenario Discussed

Problem scenario:

1. User opens Map Layering.
2. Properties Panel is closed.
3. User hides a layer from Map Layering.
4. If the layer is completely removed:
 - User must return to Solution Panel to enable it again.
 - This creates a poor experience.

Preferred UX:

- Keep the layer available in Map Layering.
 - Allow hide/show without removing the layer permanently.
-

7. Visualization Panel Placement Decision

Discussion point:

Should visualization controls exist:

- Inside Properties Panel?
OR
- Only inside Map Layering?

Current thought:

- This needs alignment with technical feasibility and stakeholder discussion.
 - Removing visualization selection from Properties Panel may simplify the workflow.
-

8. Updated Interaction Examples

When user selects:

- Bubble → Bubble moves to top layer.
 - Heatmap → Heatmap becomes active top visualization.
 - Withdrawal → Related layer comes forward.
 - Data Card → Data Card remains floating above visualization layers.
-

Key Decisions / Action Items

Open Decisions

1. Finalize **Show/Hide logic**
 - Should hiding from Map Layering remove the layer?
 - Or only hide it while keeping it available?
 2. Finalize **Visualization controls location**
 - Properties Panel?
 - Map Layering only?
-

Next Steps

- Discuss technical feasibility with:
 - Chetan
 - Tim
 - Abhishek
 - Other stakeholders
 - Add recommendations and screenshots to DevOps documentation.
-

Final Understanding

The workflow direction is approved from a UX perspective. The remaining focus is resolving **technical consistency between Properties Panel and Map Layering visibility behavior** and deciding the final ownership of visualization controls.

you can see things is updated over here

okay this is the feature this

is the feature and I already updated the stuff here okay with the description data are floating on

top layer panel bar over litma turn on data card or turn to data card okay this is the workflow

this is the previous workflow okay okay

oh this thing is this thing has been updated in end-to-end workflows okay so

as i click as

i use handle and move the layer things will be go up and down right and i go over and change to

data card go to data card and you can see data card has moved up right and if i go ahead and change

data card to bubble it will remain there itself okay so at least user will get the fixed position

in that sense otherwise

supplying the placement all the time it's not good choice good approach for the user okay user go

ahead and change to data card right you can do the pinning and all right you can do pinning and all

you already aware of this i'm going to walk this the pinning all pinning and

if your user wanted to go ahead and play with the other capabilities of editing capabilities so

user hover and click on edit edit panel will open and from here you can do the wanted to see the

only pin all if i wanted to clear all pin let's say these are the pin and i wanted to clear all so

this can clear these are the existing capabilities so

as i mentioned earlier i updated the workflow in all the many items okay as i hover and change to

data guard what happens is Can you see withdrawal has come on, bubble up on the upper surface.

Okay, if I change it to bubble, it will go down.

A data card will remain up front or top all the times.

Here I can go ahead and check the editing capabilities like value unit,

value unit property, value unit property object name. We already gone through this earlier.

no change in that sounds good okay

if i shuffle shuffling right i wanted to move this injunction on top right and right now here the

value you can see on the data card is max volume you can identify that by color there's a move

injunction of you can see the injunction come up with the black color indicator that you can relate

the things over here if i move that down addition down okay to third place max volume will come up

on the data card as well you can see the number color has changed okay sounds

good

yes this

is already we have gone through this earlier i wanted to see all card you can see all card max

volume is on top okay and uh withdrawal and engine is hiding below that okay

you can see the only pin card okay

here if i click from if i hide a layer from properties panel it will hide from here it will move from the layering panel all right if i click on a property on property panel it will add up in a layering panel but but if i move from the height from the layering panel it will remain there itself okay it will not move out okay so user can turn it on again again so even the absence of solution panel user no need to go back again to solution and turn it on again okay you got the difference hello

uh yeah vishal uh aniket what do you think of this like while developing will this be a tricky for us or not

aniket you are not audible

aniket

uh we shall last time did we discuss on the video demo this part too yes okay fine yeah let's go and let's see you got the point right we have yeah okay user can hide and show the property from the corporate panel as you write layer panel so how things will be handled from both end that is what it is okay yeah okay so

if i turn it if i click on bubble then

i jump to bar okay

So you can see the difference. You can see the changes in a layer panel. If I click on heat map, right?

If I click on condition, condition will come up. You can see as my selection goes, right? You can change, you can see the changes in a layering panel. So what does this mean? If we click on the, from the properties panel on the icon, that layer goes on the top, right? Yes.

Yes. Okay.

I'm out of it.

I'm not clear about that one scenario.

Hide and show. So when we click on any,

let's say I have click on max volume from the properties panel, right?

So we have max volume over here. So if we uncheck it.

Okay, we have max volume over here, which is where max volume is available over here.

sorry mean volume sorry mean volume okay now how things will be handled if user turn off the hide the mean volume from the property panel it will move out from the layering panel okay because as i'm selecting with your property that i'm selecting property layering panel is made of that only which is a this is the correct behavior right now other way around if user hide properties max mean

volume from the layering panel okay its height from the layering panel its height from the here itself its height from

checkbox its height from the property panel and height from the layering panel as well but this chip will remain here the layer will always remain layer will be persistent on the layer panel only thing is that it will be hide okay

but we will have a single source of truth right right right how this can be handled as

a state will be a single thing which will be from properties panel and the map layering okay

if that is the case uh we will take a call on that later okay yeah right so if there is a technical limitations we'll manage the things according to that

mostly it will be visual because we will have a single source of data so we cannot handle two different scenarios in that okay so means we have to store a state that from which it is clicked means it's clicked from map layering or it's clicked from the properties panel so

i think it's not better way sorry yeah i think it's not a good way so we can discuss on it once

after this call like do we approach uh for this approach means uh when we're clicking from the properties panel it's still showing in the map layering but sorry when we click from the properties panel it will remove from the map lighting but if you click from the map layering panel it will still in the properties there are two scenarios what is the default view default view if user

doesn't select making anything from property panel there won't be any layer panel exist so as users start clicking the properties layering panel will start filling up with that right now that is

approach right that's the default view here now we are trying to address the use case here the use

case is my property my property panel is closed okay but i am hiding the layer from layering panel

if i remove that complete section or complete layer completely removed i need to go back again in solution panel and turn it on that is a very long way it is a very bad user experience right so we

need to you know check this you know user user's behavior okay if properties panel the solution panel is always open then removing the complete layer from layering panel then it's fine you know

turn it on turn it off okay i just wish i just have suggestion that uh properties panel checkbox

and map layering checkbox should be a consistent both should be consistent means if i'm hiding from

the map layering panel right so it's also unchecking from that properties panel let's say we have

that uh mean volume right if i uncheck from map layering it also uncheck from the properties panel,

in the properties panel. But if I uncheck from the properties panel, it's directly get removed from the map layering. That scenario, I think it's not consistent,

right? It's a consistent. So am I adding,

so whatever behavior, so as I'm clicking in the property in property panel, layering panel will add

up that as a layer. As I'm removing from the property panel, It's removing the layer from the

property panel. I don't want that layer anymore. Vishal, I get your point. But technically speaking, we will have a single source of truth. And in that, we won't be able to achieve this thing. But let's see technically how much this is feasible. That's what we are telling. Okay. So you have a word with other guys as well.

Think on it. With whom? I mean, let's have a word with Chetan, right? yeah yeah sure yeah okay you have a word with him based on that we'll take a call yeah yeah sure sure yeah okay so it's not a something usability issue that you know yeah yeah no just this part only we are talking about yeah okay

we already gone with this as i click on bubble bubble will come on top layer panel okay no need to go back again if

i move bar can we see bar the layer panel i'm i'm here

okay i am giving shadow price on top little up so you can see the moment in the property panel right like

what moment in the properties panel visual okay now where are we we are on net injection oh yeah okay uh bubble right so now in the layer panel this could be one scenario now in layer let's say user has move

okay so here shadow price is on the selection okay uh okay i had a discussion with chetan about this uh mostly we are gonna remove this uh this selection from the properties panel and have it in the map layering i guess we also had a discussion right vishal i told you in the office that we are thinking to do in such way yeah that's fine i am fine with that just yeah just make sure that uh we'll add up this in devops that uh yeah sure i will discuss about this too in with chetan because if that is removed then this flow will be getting getting removed right that's why it will alter it will narrow down the workflow yeah yeah that's why yeah so we need to create a workflow according to that okay so you have a word with chetan and just add up the recommendation right yeah sure along with the screenshot in devops so according to that we'll take a call right yeah sure here i'm having i'm moving just moving shadow price just about the mean volume okay so you can see that there is no change happen here because i just remove the just move it to the one layer up okay not on top

here i remove shadow price on top okay you can see bar has come on top in the map but no change in the property panel as such

change okay if i click on data visualization select the view type select as bubble right so we can see as soon as i change to bubble bubble has came on top shadow price has came on top right then i can go ahead and make the edits if i click on edit this panel will come the other end okay because no need to make the anyway you are going to know different approach over here

if i turn it to bar it will turn to bar again

which i'm going to edit edit panel will be shown over here so

this is the entire workflow basically as i'm selecting the the editing you see the that need

ingestion no need to update so if i click and edit yeah

shadow price is updated cool

Anything, any question on this?

Hello?

Yeah, just a minute.

Aniket, any questions you have?

Not sure. So, we already discussed on if all the panels are open,

right? Do you remember, Rabo? No, I don't remember. Okay. The one scenario in which we will have all the banners, that thing. Right, right. Is that clear? I don't know.

I don't know. I guess last time we were discussing and it was not completed. Right, Vishal?

We discuss, we finalize, based on that workflow is updated and DevOps is also updated.

So design and DevOps, everything is updated. You can go and check there what would be the behavior look like on layer legend and all panel opens. Here we are talking in the particular context of layering. Okay, understood.

Understood this part here. So here... user has started his journey from property panel and then into the layer panel how things will be handled in that way and that is what capture in this okay so point is let's say bubble and change it to okay

stone yeah so as I click on ingestion ingestion will come on top layer right when there is no data card right no data card there

let's see heatmap if I click on heatmap in property panel heatmap will come on top in the visualization layer ok but card will always float on top

ok so as I click on withdrawal you can see the re-withdrawal is jump on top this

is the related line so as I click on property 2 the pie chart will update ok and this thing will appear visualization and I'll let it here. Line data card.

As I click on data

card property one, it will move on the top.

Okay. Any questions? There's something additional thing. Okay.

How things will behave when user click on. If there is a card with the visualization, only visualization, only things will be behaving on a first click on a line. That is what it's captured over here in this section. Just a small question,

Vishal. So, is there any scenario,

means why we are taking that layer to the top when we are clicking from this properties panel?

Means, I think when we click on that Pro 1 data card, data card will be come on the top in the layering part, right?

Okay.

Okay. Yeah. Understood. No issue.

Okay. Any question?

Not as of now Vishal, but once we proceed, if we have, we will reach out to you.

Sorry, once I proceed on what? Once we proceed on the development part also, if we have that time any questions, we will reach out to you. Okay, development part. Proceed with the development part.

Yeah, that time if we have any doubts, we will reach out to you. Okay.

Also, I will discuss with Chetan and get back with her. Also, discuss with Tim.

Yeah, just make a call on that. yeah and keep add abhishek as well there abhishek and all other stakeholders okay yeah yeah sure yeah this is a big change so please include all the stakeholders yeah so basically two parts we need to discuss one is show hide and another is the properties panel that sorry visualization panel we should have it on the properties panel or not or just on map layering right another thing just two things right other one one is our show and hide logic right from map layering if we uncheck it should we remove that flow yeah it's only two things I guess as of now so we'll discuss with Chetan and get back to it maybe we can block the user from to block the user from hiding I mean he's not able to hide the layer from the map layering panel it will remain all the time available for the user That way we can do that. Okay.

Yeah. Let's see what we can do. That approach is also a good approach. Yeah. So once user has selected the property of each choice, he will close the property panel and that's it. He'll remain in the context of... Let's see. We'll discuss with Tim Vishal on this technical feasibility question here actually. Yeah. Yeah. because so we are we are done we we analyze the workflow this ask maybe came from the other reviewers and all that way we can say that we explore the workflow we build technical challenges not worth so we'll you know alter the workflow flow according to this okay sure yeah anyway cool okay just uh let me know what happens on this yeah sure yeah yeah cool thank you bye thank you ishan Thank you.
