

Landing Page & Tagging Design Review (Round 2)

1. Study Card Patterns

Three study card states were reviewed:

1. **Private Study**
 - Default state
 - Hover state
 - Favorite state
 - Favorite + post/message state
 - Shows:
 - Study title
 - Description
 - Tags
 - User initials
 - Active editors
 2. **Public Study**
 - Anyone can access/edit
 - Only current user's initials shown
 - Same card structure as private
 3. **Requested Access Study**
 - Shows study information
 - Hover provides "Request Access"
 - More information available through expand action
-

2. User Presence / Collaboration

Current Design

Two user groups were shown:

- Left side:
 - Users actively editing the study
- Right side:
 - Users assigned/available but not currently editing

Decision

- Active/online users are important
- Assigned users list is less important
- Remove unnecessary user visibility from card

Need coordination with Madhu for online-user implementation.

3. Posts / Comments Behavior

Post Indicator

- Initials indicate who posted
- Example:
 - One person → show initials
 - Multiple users → initials + count (+2 etc.)

Hover

Shows:

- Tooltip with message preview
- Who posted it

Concern:

- Long messages may create huge tooltip

Need to evaluate better handling.

Click Behavior

Clicking post/comment chip:

→ Opens right-side overlay panel

Panel contains:

- Study details
- All messages
- Reply option

Do not expand card inline.

4. Icons Behavior

Favorite

- Hover → tooltip
- Click → add/remove favorite

Comment/Post

- Hover → comment tooltip
- Click → open right overlay

More Menu

Contains relevant study actions.
Detailed options will be finalized later.

5. Study Title Handling

Rules:

- Single line
 - Two-line support
 - Longer titles:
 - Ellipsis
 - Hover shows complete title
-

6. Tagging System

Add Tag

Entry points:

- Study card hover
- Home screen tag section

Behavior:

Click "Add Tag":

→ Expand panel

Panel contains:

- Search
- Available tags
- System tags
- User-created tags

System tag:

- Disabled

- Message: non-editable system tag

User tags:

- Add/remove allowed
-

7. Create Tag

Flow:

Click "+" Create Tag

→ Full-screen modal

Fields:

- Tag name
- Color

Click Create:

- New tag appears on top
- User can close tag

Same behavior from:

- Home page
 - Study card
-

8. Edit/Delete Tag

Hover tag:

Shows:

- Edit icon
- Delete icon

Edit

Modal opens:

User can:

- Modify tag
- Apply changes

Updated everywhere.

Works for:

- Selected tags
- Non-selected tags

Delete

Confirmation dialog:

"Do you want to delete tag?"

Actions:

- Cancel
- Delete

9. Tag Tooltip Discussion

Decision:

System tags:

- Tooltip required
- Example: "Non-editable system tag"

Normal tags:

- Tooltip not required
- Name is already visible

For "+3 more tags":

- Avoid tooltip
- Use popup with chips
- Allow delete from popup

10. Timestamp Feature

Purpose:

Shows latest study activity.

Examples:

- Edited just now
- Edited 46 minutes ago
- Edited 10 hours ago
- Edited 2 months ago

Applicable:

- Private studies
- Public studies

Not required:

- Requested access studies
-

11. Description Expansion

Current:

Hover → More

Suggestion:

Make larger clickable area.

Click:

→ Expand description area

Behavior:

- Existing card expands
 - Does not push layout
 - Overlaps other cards
-

12. Panel Expansion Behavior

For panels like:

- Add Tag
- Description
- Activity

Decision:

Avoid popups.

Instead:

Panel overlays content while keeping user context.

Benefits:

- Cleaner layout
 - User remains connected to selected study
-

13. Sorting

My Studies

Removed:

- Study Owner sorting
- Created By sorting

Reason:

Users care more about working on studies than ownership.

Final sorting:

1. Last Viewed
 2. Study Created Date
 3. Study Title (A-Z / Z-A)
-

Tenant Studies

Same approach.

14. Study Activity Panel

Current idea:

Sort by:

- Date/time
- Study
- Activity

Discussion:

Avoid introducing new component patterns.

Reuse existing PLEXOS Cloud activity card.

Final:

Sort:

1. Date/time
 - Newest
 - Oldest
2. User
 - A-Z
 - Z-A
3. Study
 - A-Z
 - Z-A

Remove:

- Activity sorting

Filters:

- Study name
- Username

Click activity item:

→ Open related study in new tab

15. Quick Filters

My Studies

Keep:

- All
- Favorite
- Public
- Private
- Not Accessed
- Unread Post

Remove unnecessary filters.

Archive

No need for:

- Favorite
- Public/private
- Extra filters

Keep only relevant archive filters.

16. Global Search

Flow:

User clicks search.

Cursor appears.

User enters keyword.

System provides suggestions:

- Studies
- Owners
- Related results

As typing continues:

Results become more refined.

Selected filters remain visible.

Click result:

→ Open related study.

17. Tenant Switch

Current:

Tenant selector on top.

Need improvement:

Make tenant card more visible/prominent.

Click:

Shows tenant list.

Switching tenant updates:

- Studies
- Cards
- Data

18. Open Study Page

Current design needs refinement.

Important information:

Required:

- Study title
- Public/private indicator
- Favorite

Need more exploration:

- Post visibility
- Tags placement

Decision:

Do not show unnecessary study metadata.

19. Online Users

Requirement:

Show:

"Who is actively working on this study now"

Not:

"Who has access"

Need integration with Madhu's online-user work.

20. Study Activity From Home

Quick filter:

User selects edits from previous days.

Click:

→ Open Activity Panel

Shows edits from selected timeframe.

21. Multi-select Filters

For "Created By":

Current:

- Radio selection

Decision:

Allow multi-select.

Display:

Example:

GIA + 2 more

Click:

Expand selected users.

22. Marketing / Landing Page Content Idea

Suggestion from Bird:

Make landing page more active.

Possible sections:

- What's new
- Product updates
- Cloud updates
- Newsletter
- Company announcements
- KPIs / usage insights

Needs separate discussion.

Final Decisions / Action Items

Vishal

- Update designs based on feedback
- Remove unnecessary sorting/filter options
- Improve online-user representation
- Add missing edge cases
- Refine study open page
- Prepare for user testing

Team

- Coordinate with Madhu on online user pattern
- Discuss marketing/news section
- Validate designs through upcoming user testing event

Overall direction:

- Reuse existing PLEXOS Cloud patterns
- Avoid creating new interaction models
- Keep study context visible
- Prefer overlays over popups

- Reduce unnecessary metadata and filters
-

Okay.

So this is second round of discussion on landing page and tagging. I have created two pages because one file was getting heavy. So I break up pieces.

File name will be changed. I'll update that. Okay. So here you can see all these are document based. Now click through our entire page. This will help me to understand or explain the stuff in detail, and then we'll go to the actual screens.

In this particular screen, we are looking at the study card. We have three patterns in it, private, public, and requested for access. Within that, we have default and hover.

This is a default view. This is our view.

This is a default view with the favorite. This is a default view with the post and favorite.

Posted something, some other users has posted on that particular study.

So here indicate that initials and the post is there, so user can check that.

Post is a message? Yeah, message from other end.

Like you and me are working on one study, this study, and you post it, and I'm able to see that Ravu has posted with the initials.

And let's say there are three people, you, me, and Pankaj is working. Pankaj and you have posted, so I'll be able to see your initials plus two. That means there are two more posts.

So these are the four views or four use case,

I would say, in the card. situation basically uh and on hover if there is no favorite uh no post as such on however i'll able to see more icon over here i can click favorite or i can go ahead and mark the comment okay comment or message on how i'll get to see the chips with the cross market on

it so i can quickly remove it if i wish to And there are three more on clicking on it or on hover.

I created one sample of it. That will come in the next, some coming screens.

I'll get to see what other three chips are there. Okay. These are some other informations.

We have descriptions. And these are the initials of the users,

the private users of this particular study. what right hand side indicate what left hand side indicates it's these three guys are editing this study in this particular moment and what right

hand side indicates they are available they are there but they are not in editing or open or something like that so that way we can segregate who is working actively right now and who is assigned but not working on it right now

I would say it's not that important to have who are the users on that study right now, but online users are important.

Sorry, which one are you saying? The left-hand side one. The users who are working is important, not the users who are part of that study. So this one you are saying not that important to have it, right? Yes. Okay. Okay.

Not required. So I'm asking crossmark.

Okay. Anything else on it?

Not that I can think of.

Okay,
that's fine.

Okay, this is a public study. Public is something assigned to anybody can go ahead and edit.

So here only see the my initials since I'm opening it from my end. and nothing else rest of the thing is same identical and request access will have a more user only the details about the study from where it's coming description and on hover i'll get to see the request access button and if you wanted to read the more information there is a more available on bottom so click on it That behavior will be covered in the next screens. OK,

sounds good. Yeah. OK, so icons,

stone crash. OK, so this is a little bit detail about what will be the behavior of the icons on the card. OK, so as I hover on.

I'll get to see the tooltip where I'll get to see the message and who message what.

I don't know what feasibility is it because if somebody typed too long, then tooltip will be very long. So we need to consider that scenario, but we'll consider that later.

And as you click on this particular chip, what happens is the right overlay will come up with all details. about the study and study name and all of the study details.

Here I can see the messages and in the bottom I can reply on it. Yeah,

icon over not applicable. This is the one thing. If there is only one post,

no change as such. Only one post will be there and you can comment on it. If there is only comment icon, tool tape will be comment clicking on it and I can go ahead and.

so you are saying that this comment section will expand no no no it will come on right early remember in last design okay okay right comment overlay that's what not expand okay so favorite will be tooltip and yeah click on it then remove favorite and uh in more this with the more and more will be contained uh this many options so this will be relevant options that we'll cover in the next screens so

yeah So study titles, if there is longer studies,

it will accommodate like this. So single line, two lines,

if they're longer, if it's more than that, then we'll introduce ellipses. And hover will show the complete name.

Add and remove tag. So default view as a hover, I can see the add tag.

So clicking on add tag, what happens is the panel expand. Only the title will remain on top, public study, private study, whatever it is I mean on top. Search, I can help that for the finding tag because it's a larger quantity. It's better to have finding.

Here I can see all the tags. Default, sorry, desktop will be on top.

It is disabled, and there is a message, system tag,

not available, right? And rest of the tags user can go ahead and add or remove.

So in this particular case, I click on nodal, and nodal has been removed.

Okay. And the message will appear.

Okay.

This one? This is the rendering error.

Okay. So instead of close tag,

can we simply say close?

Okay.

Sounds good.

Okay.

Should I go next? Yeah. Okay.

so create tag default hover then tag click attack and we have a create tag over here right so if user wanted to create new tag user will hit on it so what happen is modal window will appear on the on the entire screen right it covered the entire screen where i can and i can define the name color and hit the create button Once I create hit, the newly created tag will be added on top, right? And then user can close tag.

Sounds good? Yeah. Okay.

Timestamp.

So timestamp is particularly coming over here. It's basically indicate that which study that I'm actively working in. like over here, edited by just now. And how long back did I or anybody else had edited on that particular study? Like this particular study is edited by this many people 46 minutes ago. So that's what the timestamp is. So hours, days, and two months and years. And it will be applicable for private and public, both the places and request access for It's not relevant to the request for requested access.

So what's your thought on this?

I edited

46 minutes over, edited 10 hours over, edited just now. Yeah, that should be fine.

Edit tag, if I wanted to edit the existing tag. So we are aware of this.

So as I hover, what happens is I'll get to see the edit and delete tag icons. So if I click on pencil, a model window will appear covering the entire screen and I can make the edit and by hitting apply, post-mature will appear and things will be reflected and it can be available for both selected and non-selected. So this one is selected nodal and this one is non-selected contingency condition. So it's available for both.

Good, Raku.

Tag tips.

As I hover on desktop, it says non-editable system tag. But whereas I go to other editable tags, I can give the tooltips. If user go over three more, I'll get to see what are three other tags are there.

I'm not convinced over here tooltip. Probably we can show the pop-up where I can show the similar sort of chips in a pop-up, and then user can delete that as well. That's what my suggestion over here.

Yeah, that should be.

You don't need a tooltip for a tag because For a tag, you are already showing the full name.

Do you need a tooltip for that?

Not necessary, not required.

But here we require for desktop.

Desktop one we require, but for nodal tag, you don't need that.

Sounds good.

Quick remove tag. Okay, so I

can simply remove the tag, like I click on this particular tag over here and it's removed.

And tooltip can be, sorry, toast message will appear on the screen that I need to add up.

Okay, and this number also change. All right, so this behavior need to be added up little more details missing over here. Description. So as I hover,

I'll get to see them more. And what my suggestion is, we can give this much area as a clickable, right? So that user no need to go that precise more tiny text and click on it.

So as you click on it, what happens is to expand and I'll get to see all the descriptions or longer description. And if there is the average text, the window will The width,

the opening window will remain the same. Right. But this will push the content below or how will it impact the other playbooks? No, it will overlap the other cards.

I have created one screen on that. I'll show that as well. Okay.

Tagging a panel.

Okay. Yeah, this one. So as the click on this particular panel.

Okay. sorry air caught so this is our state as you click on add tag what happens is it covers the whatever is uh below and on top of that the card will problem entire space

Same way with the, if anything comes on a bottom, let's say user click on a optimization studies, what happens is it will cover the, take up the upper space.

So that way, user will remain constantly in a context of one study and layout wise also remain nice and clean even user open any panel or any card. rather than opening the pop-up right lip up and down.

Sorting. This study activity comes from where? Can you repeat that once again?

One minute.

This study activity, this one? This one? Okay.

This one you are seeing? Yes. This is coming from our study,

right? Click on the study name. No, no, no. It is general. Here I can see the overall.

So it's always there? It's always there. It's always there. User can close it up. That's the

question.

User can open from the specific as well. I create that workflow as well. It will come in. Okay.

So sorting.

simply created a collage so that you'll get an understanding that which all tab has what type of sortings okay so on my study right we'll have this many sorting so i can sort by last view that means uh recent current yeah recent one like just now editing then 45 minutes later yeah how can you sort by study owner

Study owner is one minute. I think I heard it. Yeah,

these are the study owner, right? So study owner is Emil, then we have Hong like that.

So here is created that study.

Studies will be going under that person's section. So this is the one section for Emil, then Hong for Hong, there will be another section. Like the way we have in alphabetical, A to Z. But you can put it study in alphabetical order, right? Not study owner.

Study is in alphabetical order, right? Okay, A to Z. Yes, and then study created by recent or oldest.

That's it.

This is more confusing. Study owner and then again A to Z or Z to A and then study created by... because nobody's going to remember who created that study or who is the owner. It's more importantly that they are going to work on that study. So study title is more important than owner and the created by. So your point is, let's go with the only study.

That's what you're saying.

So that means we no need to have study owner and study created by.

StudyCreatedDate,

do you require that? StudyCreatedDate, sort by StudyCreatedDate.

What's your thought on this?

StudyCreatedDate, yeah.

StudyCreatedDate would be required.

So add

by study.

So we have three options in sort by, last route, StudyCreatedBy, and by study.

Sounds good. okay cool

uh yeah for my my tenant study i have these options study created date owner and created by here also should we go in the same same same approach yeah same approach no change right for favorite

also will remain same and archive and that also remains all the other places it will be the same filters okay sounds good cool

oh yeah

Study activity panel here, I can sort by date and time activity by study and by activity.

This is a little confusing to better words.

Here we can see that 19 hours ago, these are the edits happened.

20 years ago, these are the edits happen. You can straight away see that. I want to do it by time-wise. We have time-wise in current implementation, right?

Correct. But if every hour it's happening, how do you want to show it?

You want to show it for every hour or every six hours time frame? How is it?

No, I'm not getting your question. Because someone or the other will be working every hour, right? So you want this to be in every hour? uh for last 24 hours each hour you need to show or how do you want to okay within a last last one hour or within the last six hours what are the edits happen that's what you're saying right no i don't have any clue i need to understand the user behavior some people work on a study for you know longer time than how things can be managed need

to understand uh user behavior then we need to take a proper call on this right What's your point? What's your thought on this? What I would suggest is just show the activities and don't break it in an hour.

Because this 20 hours ago, this time, this thing, it's already going to come in this activity card. it's already part of the activity card you don't need to have it separately and then segregate it because otherwise you will have to create a new component here itself okay so you're saying that whatever we have use the existing study card itself this activity event card itself and show that time in you know by latest or oldest whatever way you want newest latest by you know default that should be okay your point is try to reuse whatever plexus whatever we already developed in a plexus study a plexus cloud right correct okay and then i'll have filter to filter by uh you know the study name to filter by the username right that i'll be there and clicking on any of the event i mean whatever clickable events are there, it will open the respective page with that respective study open in a new tab. Yeah, that's it. That's what I thought of,

but haven't created workflow, but I already thought of that. Yeah. Okay. So here in sorting, no required. Date, time, sorting, that is not required.

This doesn't require. We'll do it.

Correct. By activity is not required by study A to Z or Z to A.

Yeah. By activity is not required. I don't understand by activity.

So, yeah. Okay.

One minute.

Jesus Christ. Yeah. By activity, this was using. And activity by is, what is activity by? Both are same, I think. No, that's what I said. I'm confused.

I don't find the correct terminology. So here you can see activity by.

So John has performed this many activities. That's a user. Okay, activity by a user. Activity by the user.

So I keep this longer. User, we can say. Man,

I need to back on. Okay, by username is fine. You don't need to define activity because it's already an activity panel.

You don't need to define activity by user. It's just by user.

By study, that should be fine. By activity is not required.

It's not required. Date time would be newest oldest.

By user would be A to Z or Z to A. And by study would be A to Z and Z to A.

Right. We already have that. Okay,

cool. Three dots opens this. Yeah, three dots open this.

This will open this particular panel. Okay.

Yeah.

Vertical tabs, quick filters. Okay. So in my studies, I'll get to see all.

I'll have favorite, public, private. not access study and unread post plus i can go ahead uh i have performing uh pages also it's just to have a look high level view what are those quick filters are there so i can go ahead by uh filter by created by and all other steps okay correct so this is for my tenant my tenant will have a assigned to me which is additional over here uh favorite will have this many.

Archive, I don't think require favorite or I mean, you suggest over here.

Favorite doesn't require. No filters, only created by those can be fine,

created by owner or created on. But otherwise, this unread post public-private is not required.

This doesn't require.

Screen grab.

this is a and

for noodle uh this is a tag uh no no tag here here we required all right favorite public on all model okay that's one cool so now we jump to the actual workflows okay so this is a flow uh yeah okay home screen search so on top we will have a global search so as we're starting making the entry So as I click, the blink cursor will show and the message I can start by owner and I start editing, entering. So as soon as I enter the keyword, what I'll do, I'll get to see the particular suggestions, studies, owner and things like that. And as I go ahead, my suggestion will be narrowed down, right? And I click on it. So what I'm going to take me to that particular. results i can go ahead further add more like i added ro so it gives me the relevant search and i did more so i'll get to see the whatever keyword whatever i selected and as per my entries the things will be get to see in a vertical tabs and the really want to dab that tab will be remain available for the user Sounds good. What's your thought? Yeah, I'm fine with that.

Okay.

Tenant change. So we have tenant over here on top.

So I keep the card over here. It's not that much visible. We need to make it more prominent.

So as I click on it, what happens is I'll get to see what all tenants are there. And I can switch to any. Based on my switch, the the whatever information on bottom will get updated right and uh go

ahead and change it again okay uh

open study so as a hover and uh as i click right what happens is study will open in the new tab right so here i don't require any more drop down Here I can see what the study belong to.

CLI and things like that. I can see the post, favorite, public and all.

You want to have it here? The position? No,

position. I'm not convinced with this. This is just created. I'm not convinced with the design. I need to work on the design part.

because more importantly i want to see online users in this study online users so online users we have online users over here uh right but this is a public study so this is uh the users who are accessible but online users users who are part of the study right is is we are showing over here

right in a private study it's

so In the private study, we show who all users are part of this study.

I'm saying online users who are active on that study. Okay,

active or editing that study. So that's what you wanted to show here,

right? On the top. That might come. So you will have to coordinate with Madhu on that.

He is working on that, so you need to coordinate with him on how are we placing this

thing, particularly online users. So active users, to show you who is working currently,

right? Hans Roddy, right? Who is working?

And here it shows what

our users can access that study, have rights to open the study,

right? That's what it is.

Cool. So Madhu is working on this? Madhu is working on online users. OK.

That can be carried over here. Otherwise, two differently than will be get created. OK.

What about this information?

Is that fine? I mean, design is not... Oh man, where is it? Okay,

yeah. So, yeah.

You mean the post? No, this particular thing,

the tag of this study, like showing the tag,

if there is a post, unread post that I can see here on top, and I can mark favorite or remove

favorite tag from here itself rather than going on the homepage and do the stuff.

I'm not particularly convinced to show all this here.

Do we need to show these use cases on this page? Then we can explore the design.

These use cases doesn't require at least at all. That's what my question is.

So you're not happy with the position or these are not relevant use cases or this particular page

that I'm not getting. Only favorite makes sense here. Okay. Okay.

The public and private study icon, right? That needs to be against the study name.

Okay.

Otherwise, the other... Hello.

Hello.

Yeah.

So we need to have a favorite, public and private icon will be there next to study title.

Post and tags do we require? Then we can think of the better position or bacon or image for arrangement for that.

No. So do we require tag, which tag this study belong to?

No. Okay, this doesn't require, in your opinion. And the post? somebody mark something from other end, I'll be able to see. Otherwise, I need to go on a home page and do the stuff.

Fine. Should we go to next screen? Yeah.

Clicking on this icon, take me to the home page.

I can go back and forth like that. There are a couple of other use cases.

Let's say user has opened a study and he closed the home page. Then home page is open.

Let's say user has opened one study from one tenant and then he switched to another tenant and then

how study will react. So that use cases will capture later, the age cases and scenarios that have not covered.

Quick filters like favorite, then public, private, not access. So not access, I can request for access.

I wanted to see what are the edits that I made 10 days ago by these guys, John Scott, Rich and all other guys. So as I hover, as I click on view edits, what happens is the activity panel.

What happens?

Yeah, so activity panel will. get to show that particular uh data about what all edits happen on that day or that particular hour of time and

clear the click on close it will clear out and it will go take you the default straight like uh so my tenant study quick filter again favorites public uh private no sex is not access study

So if I wanted to use this, wanted to see a study created by, so I click on it, what happens is window, dial, this thing. Can this multi-select?

Here you have the radio button.

So can this be multi-select?

Okay, multi-select also work.

So in that case, if

user select the multi-select, then chip won't be relevant over here, right?

Yeah, you can say GIA plus one more or GIA plus two more, something like that.

Yeah, that way you can do it. Clicking on that, it will expand that selection.

Okay. Need to identify the behavior. Multi-select, you want multi-select over here.

Cool.

So you got this. Favorite, quick access. So you already told me that we don't require all this, right? You don't require all this. You require only this one.

This we already discussed, right?

Then archive also, we don't require all this, right?

I think I'll refer that, which we require for archive.

No tag.

Same thing will remain. We already gone through this.

Create tag from home screen. So I can create tag by simply click on tags plus icon.

Define the name and hit create. The tag is added over here. Need to add one more post message.

Update tag as I hover. As I select, I'll have a pencil icon.

I can edit the tag. Apply, it will reflect all over the place.

Hello. Right. Sorry, you're breaking up.

Hello.

Yeah, tell me. Hello. Yeah. Hello. I saw two different approaches for creating tag.

Am I audible? Yep. So creating tag. Oh, yeah, we have tag.

We have plus icon over here. So as I click on it, what happens is I can define the name. I understood this. But I also saw create tag from the study card as well.

No, it's the same thing. It's the same thing. Both the cases, model window will appear.

No, that is correct. But here it does not show add tag on the study card. Add tag on study card. Wait, one minute. That comes on hover. Okay.

Does it come on hover? Yeah, it's come on hover. I'll get to see all the actionable elements. Okay.

So it's coming on hover. Okay.

So update tag and delete.

We already gone through this.

So delete tag will ask for the message. Delete confirmation. Delete tag.

Do you want to delete tag? Asking for confirmation. Cancel will go back. I understood that. Yeah.

So reply post. So I click on post. Okay. I understood that as well.

Okay. So okay. Cool. so there is some uh suggestion from uh burned he wanted to see uh he wanted to

keep landing page more active by introducing some other marketing elements like whatever you post

on social media like this particular event rather than going on other platform i can see you here what's going on in cloud side or company side I can see here on what is happening on the cloud side. The newsletter. Yeah, newsletter. I mean, this has given a rough idea.

I don't have much clarity. We need to have broader discussion on this, what need to come over here.

You can see what's new, the product update on a desktop side,

cloud side, and then marketing side, and then we can show the activities probably.

on kpis like we have some rights like rendering rights and all that we can show what are the user we can decide the kpis basically so these were some solution that born has given but required a broader discussion on this so

yeah that's all from my side all right yeah this looks good it's fine

The next step is Bird wanted to do it for the user testing on the coming event.

I believe you are aware of that.

Athens or somewhere, I don't know. Or Lando.

He wanted to check user reaction on this.

Whatever we have discussed, I'll implement that.

You can go ahead and add your suggestions on the screen.

I'll post the links.

I think we are in good shape.

I'll add up some more scenarios which you already discussed and which I already figured it out from mine.

Let's see how things go.

Thank you. Take care. Bye.
